Kahagayo

कहाँ गयो? Where did my money go?

Kahagayo is a personal finance app for Android that records every baht you spend, from your bank, TrueMoney and cash, mostly without typing. It answers questions about your money in plain language. *Hatti khoi?* (where's the elephant, the 1,000-rupee note) is its mascot's line.

> Status: **planning and scaffolding** (November 2026). Spending has been logged since 1 November 2026 in the web tracker; the Android app is next.

How it fits together

Questions take the cheapest route that can answer them:

Question	Route	Cost
"How much on food this week?"	SQL over the database	no AI call
"What do I buy at 7-Eleven?"	local graph search	fast model
"Why did November cost more?"	monthly summaries	larger model

More detail: docs/architecture.md.

```

Getting started

First time on this laptop? Follow docs/setup-windows.md.

Run the lab API in Docker:

```bash
```

```
docker compose up --build lab
# open http://localhost:8000/health
curl -X POST http://localhost:8000/import -H "Content-Type: application/json" --data-bina
curl http://localhost:8000/months/2026-11/summary
curl "http://localhost:8000/graph/related?node=merchant:7-eleven"
```

Run the tests:

```bash
docker compose --profile test run --rm test-parser
docker compose --profile test run --rm test-lab
```

Without Docker: `node shared/parser/test.js` and, inside `lab/`, `python -m unittest discover -s tests`.

Lab API

Method	Path	What it does
GET	`/health`	OK and the number of stored transactions
POST	`/import`	Import a Kahagayo JSON export; re-importing the same file updates, never duplicates
GET	`/transactions?month=2026-11`	Stored transactions
GET	`/months/2026-11/summary`	Spent, received, moved, daily average, pace, by category and account, per day
GET	`/graph/stats?month=2026-11`	Node and edge counts by type
GET	`/graph/related?node=merchant:7-eleven`	What a merchant, category or account connects to

Transfers between your own accounts (a TrueMoney top-up from the bank) are never counted as spending. Money is stored as whole satang.

Roadmap

When	Phase	Done when
From 1 Nov 2026	Log in the web tracker	—
2–15 Nov	Android skeleton: database, month screen, quick add, parser port, JSON import, notification logger	the app replaces the tracker on the phone
16–30 Nov	Automatic capture: bank and TrueMoney parsers, deduplication, review inbox, receipts	most spending arrives without typing
December	Budget from November's pattern, graph builder, question router v1	a full month of data is in the app
January 2027	Why questions, monthly summaries, routing cost experiment	answers match SQL on test questions

Privacy

Spending data stays on the phone and in `private/`, both outside Git. Only the text of a single receipt or alert is sent to the Claude API when rules can't parse it. API keys go in `.env` or the app's settings, never in code.
